All values are positive, so answer obtain is optimal.

Answer 114

## Transportation Problem – VAM Method

### Voggel's Approximation Method[ V.A.M ]

Steps:

- 1) Calculating Penalty

It is an absolute difference between 2 Least cells in each Row and Column

- 2) Allot in the column / Row which is having highest penalty, in that allot the cell which is having least value  
( If the tie between penalty, then choose the cell where we can assign maximum units)
- 3) Re calculate penalty before going to next allotment
- 4) Repeat step 1 to 3 until supply and demand fullfill.
